### XPS Analysis of Disposable Gloves

#### Discussion

Many types of processing involve some degree of sample handling. In industries where cleanliness is critical to quality, disposable elastic gloves are widely used to protect critical surfaces from inadvertent contamination. If you are relying on your gloves to provide a clean barrier between skin and a critical surface, you must be confident that the barrier itself is not a problem. X-ray photoelectron spectroscopy (XPS), also called Electron Spectroscopy for Chemical Analysis (ESCA), provides a sensitive tool for quantitatively evaluating the cleanliness of the gloves that you depend on. Below are results from the XPS analysis of five different brands of disposable elastic gloves. The table shows atomic percentages of all the elements detected on the five gloves. It reveals that varying levels of Si (as silicone), S, Cl, Ca and Zn are detected on the gloves, in addition to the expected polymer components.

Atomic % of Elements Detected on Gloves								
	C	N	O	Si	S	Cl	Ca	Zn
Glove 1	85	1.5	8.6	1.5	0.5	2.6	0.2	0.5
Glove 2	78	3.3	10	-	1.1	6.0	-	1.2
Glove 3	54	0.3	26	19	-	0.1	0.5	0.1
Glove 4	76	2.3	13.2	-	1.4	4.9	0.5	1.7
Glove 5	71	0.1	17	12	-	0.1	-	0.1
